ABOUT ME

I am 3rd year architecture student passionate about creating meaningful spaces that respond to people, culture, and the environment.

Through academic projects and design explorations, I focus on human-centered architecture, contextual understanding, and sustainable design approaches.

My design process combines research, conceptual thinking, digital modeling, and architectural representation to transform ideas into functional and engaging spaces.

I have developed skills in architectural visualization, 3D modeling, and technical documentation using Revit, SketchUp, Illustrator and D5 Render.

I am eager to learn from professional practice and contribute creative and thoughtful design solutions to real world challenges

Software skills

Revit

Sketchup

D5

Illustrator

Education

Bachelor of Architecture
Addis ababa university(EiABC/SBE)
2023-present

Interests

- Human centered design
- Cultural identity and heritage
- Architectural visualization
- Urban design and public space

Language

- English
- Amharic

8.appropriate building	13
9.Urban project	14
10.Compacted kitchen design	15

Project-01

Ethiopian Orthodox Church Design Competition

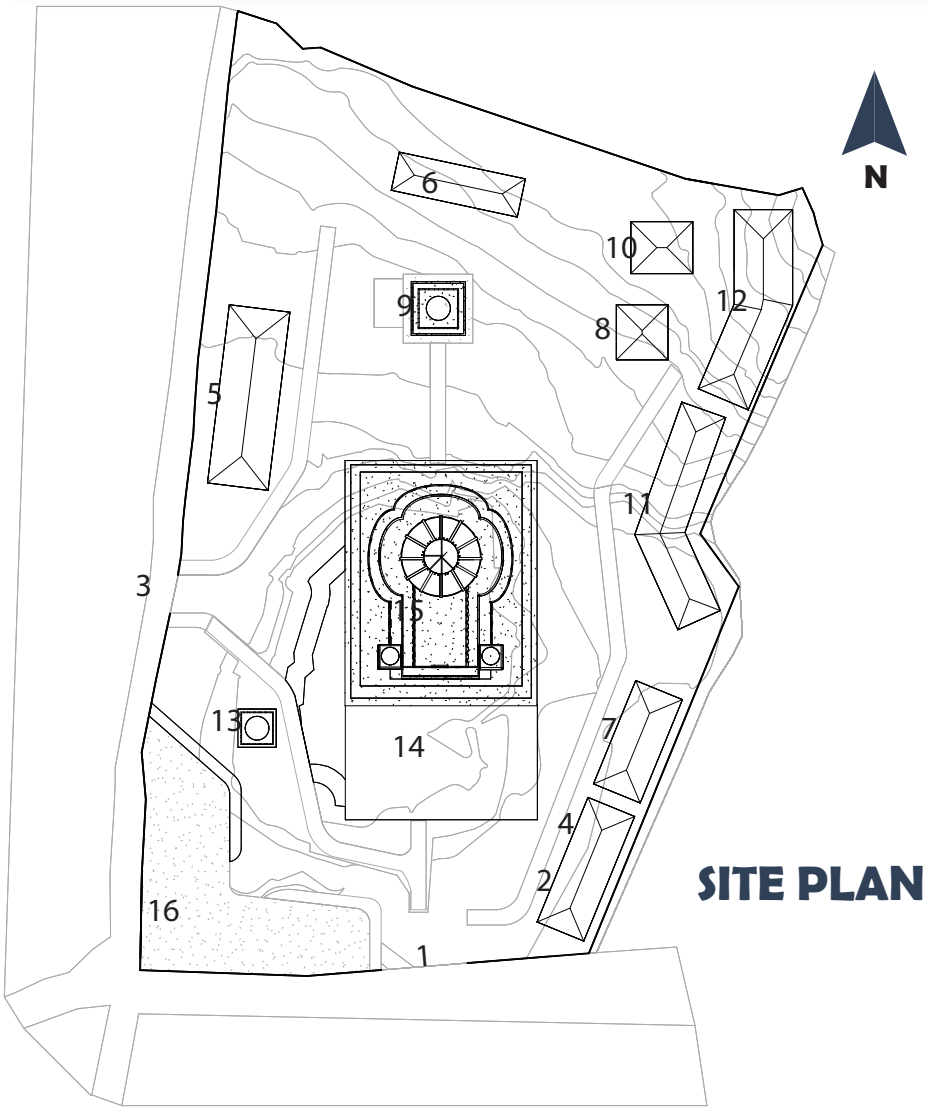

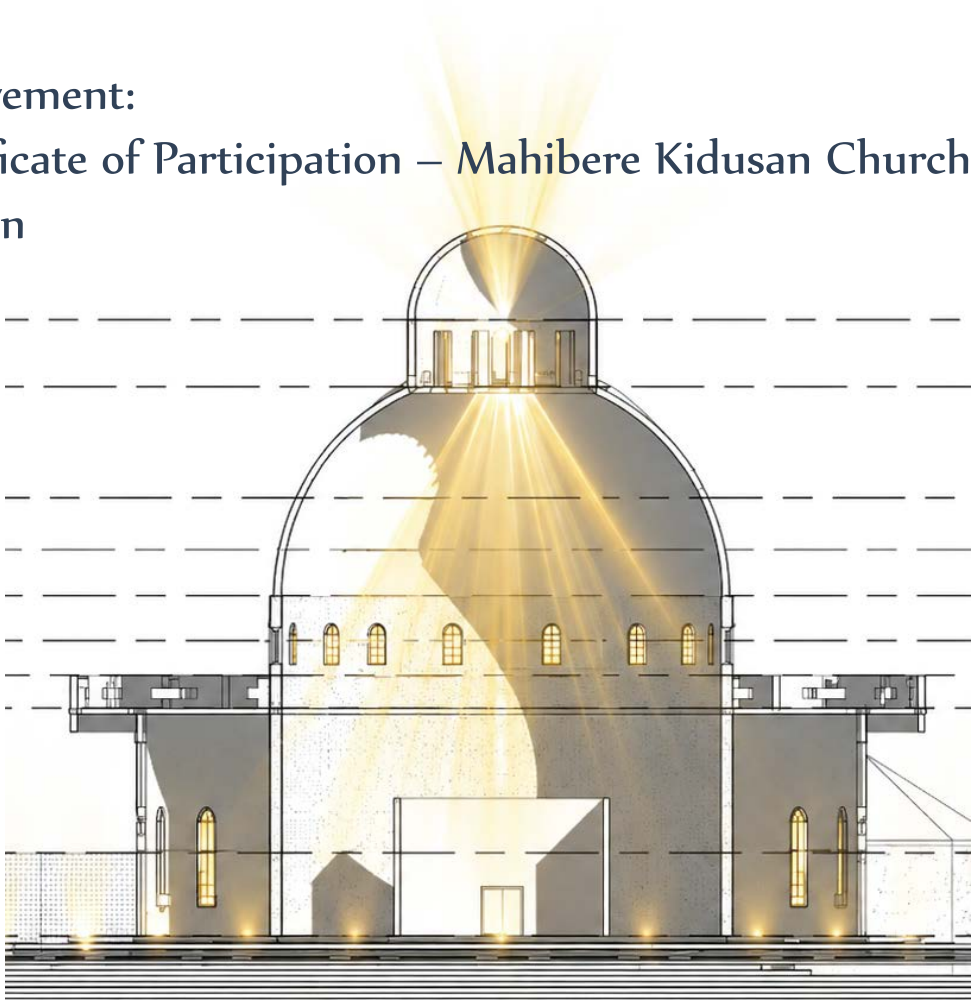

Organized by: Mahibere Kidusan (MK)

Project Description:

A conceptual design proposal for an Ethiopian Orthodox Church that explores the relationship between traditional spiritual values and contemporary architectural expression. The design focuses on creating a sacred atmosphere through the integration of spatial transformation, movement, geometry, and natural light, enhancing the spiritual experience of worshippers.

Achievement:

Certificate of Participation – Mahibere Kidusan Church Design Competition

Project-02

Enda Mikael Palace Re-imagination

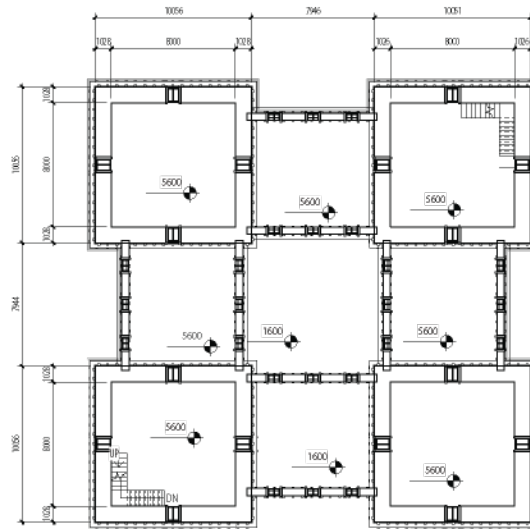

Project Type: Historical Architectural Interpretation

Enda Mikael Palace represents the cultural and political identity of the Aksumite Kingdom, reflecting royal authority, ceremonial functions, and traditional architectural values.

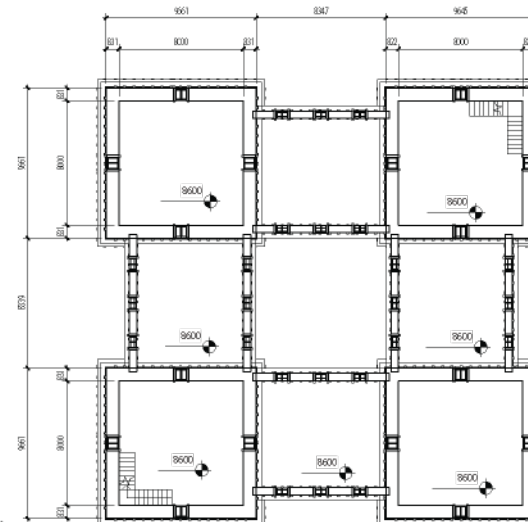

This project reinterprets the palace through a contemporary design approach, focusing on monumentality, procession, hierarchy, and spatial experience. The design preserves key Aksumite principles such as axial movement, terraced platforms, and symbolic geometry while creating a renewed architectural expression of heritage and memory.

Project-02

Project-03

Climate Responsive High School Design – Debre Birhan

Project Type: Architectural Science / HVAC Design Study

A climate-responsive high school design developed for the cold conditions of Debre Birhan. The project focuses on passive environmental strategies by analyzing solar orientation, latitude, sun path, and daylight conditions. The building form, orientation, and openings are designed to maximize solar heat gain, improve natural lighting, and create comfortable learning spaces while reducing energy demand.

Key Concepts:

Solar orientation for effective heat gain

Passive heating strategies for cold climate

Daylight optimization through building openings

Climate-based spatial planning

Project-04

Street Playground – Seminar Week Project

Project Type: Children's Play Space / Urban Intervention

A child-centered street playground designed for children under 6 years old, transforming an ordinary street into an interactive and playful environment. The project is based on the concept of a "playful journey," where children explore a sequence of spaces through movement, imagination, and discovery.

The design encourages physical activity, creativity, and social interaction by integrating playful elements, sensory experiences, and safe areas for children and caregivers. It demonstrates how urban spaces can be temporarily transformed into inclusive environments that support early childhood development.

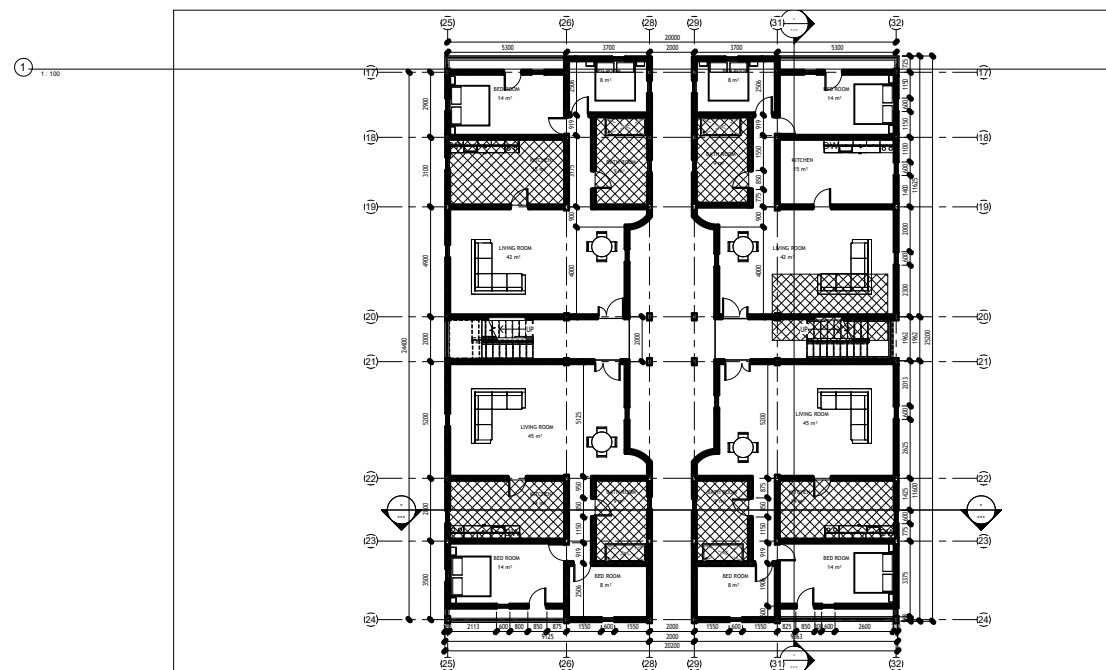

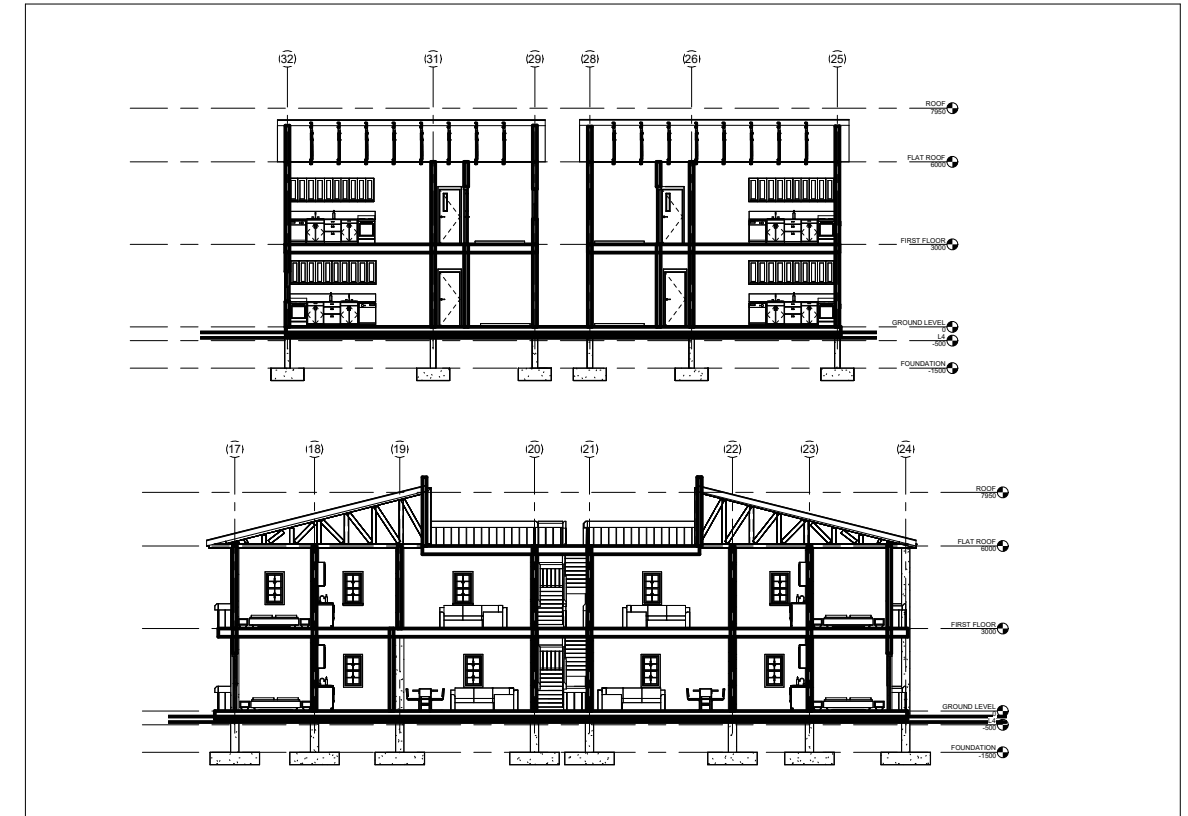

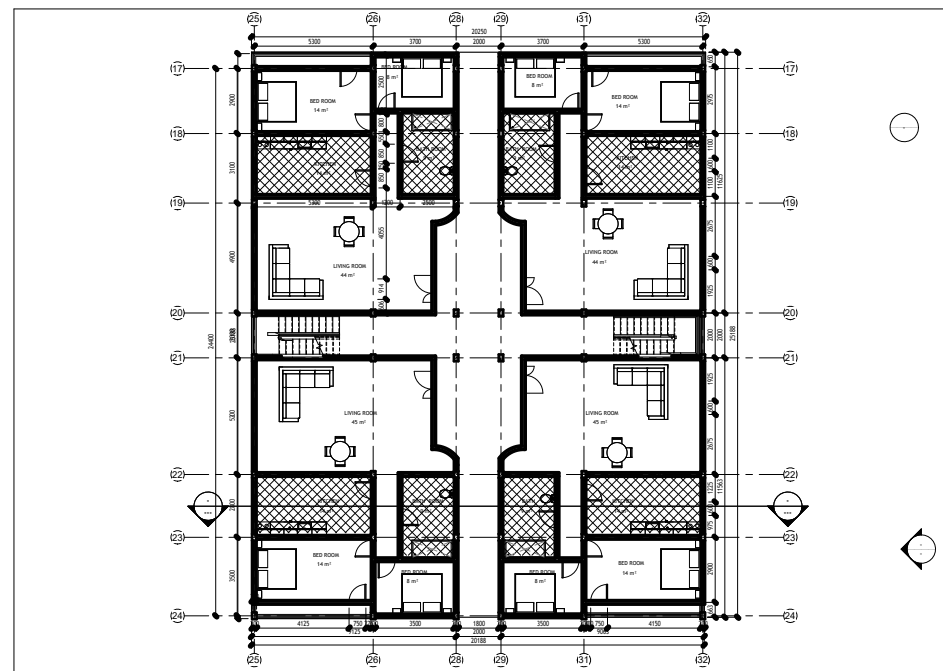

Project-05

Adaptive Corridor – Residential Buildings

Project Type: Residential Design

The residential buildings are designed as flexible living spaces that respond to urban needs while creating a balance between privacy and community interaction. The design integrates efficient spatial organization, natural light, ventilation, and shared spaces to enhance residents' quality of life.

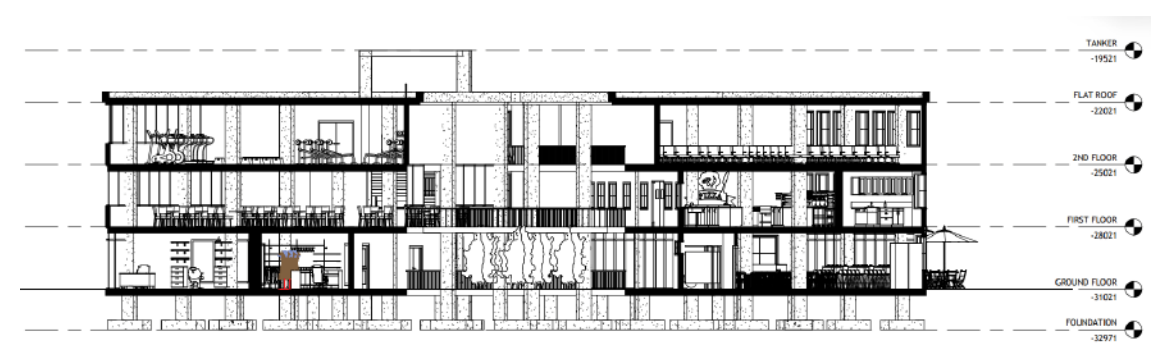

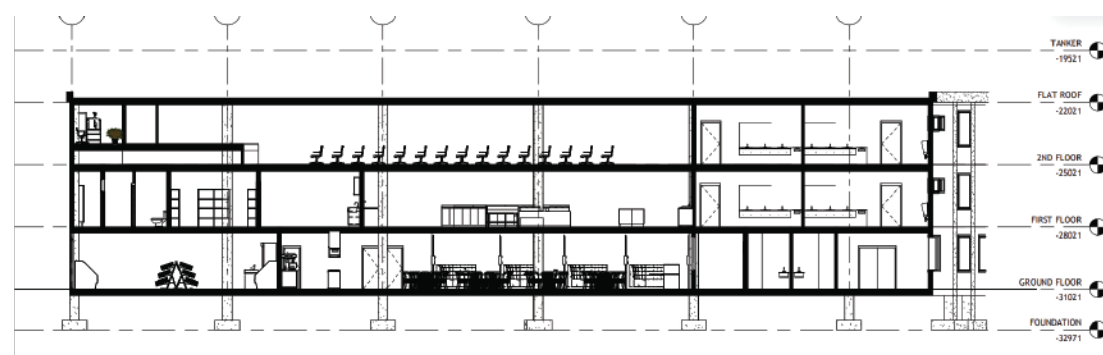

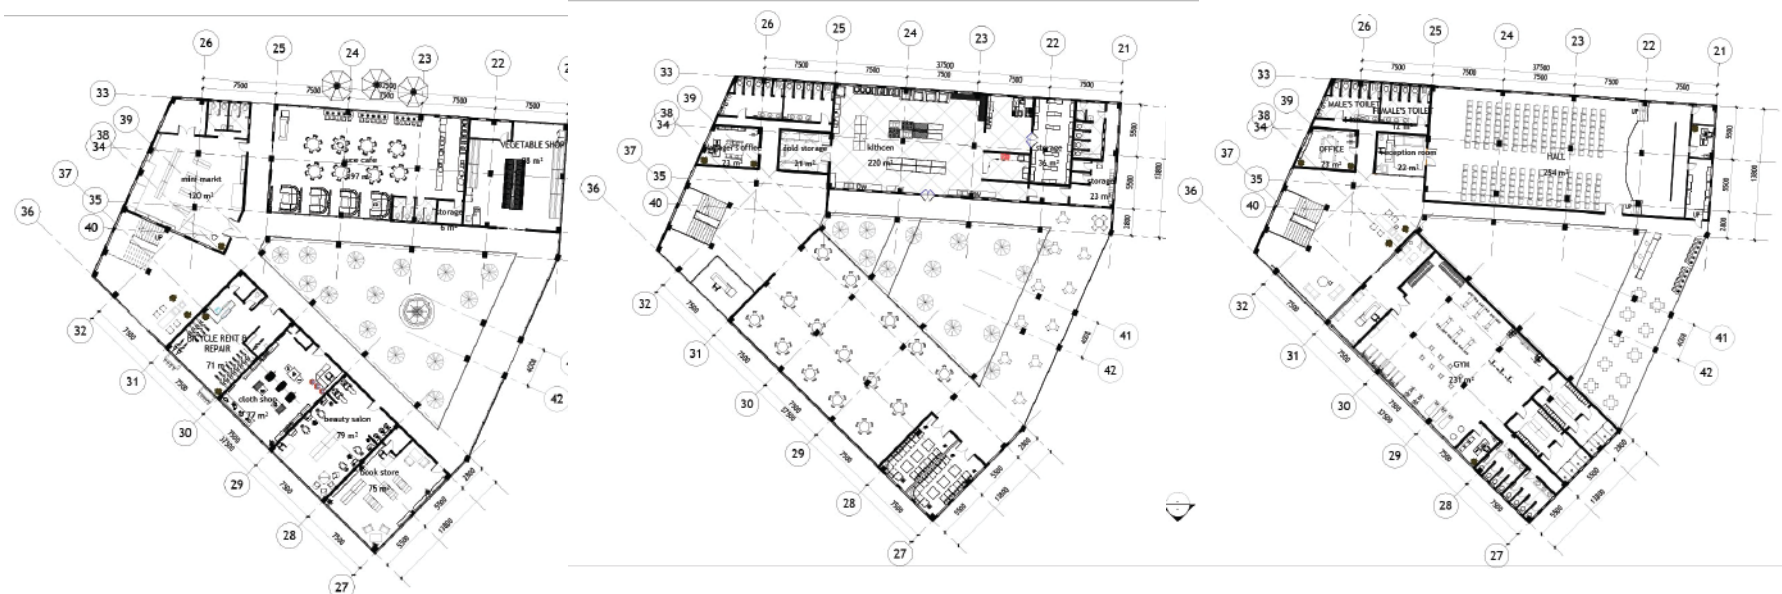

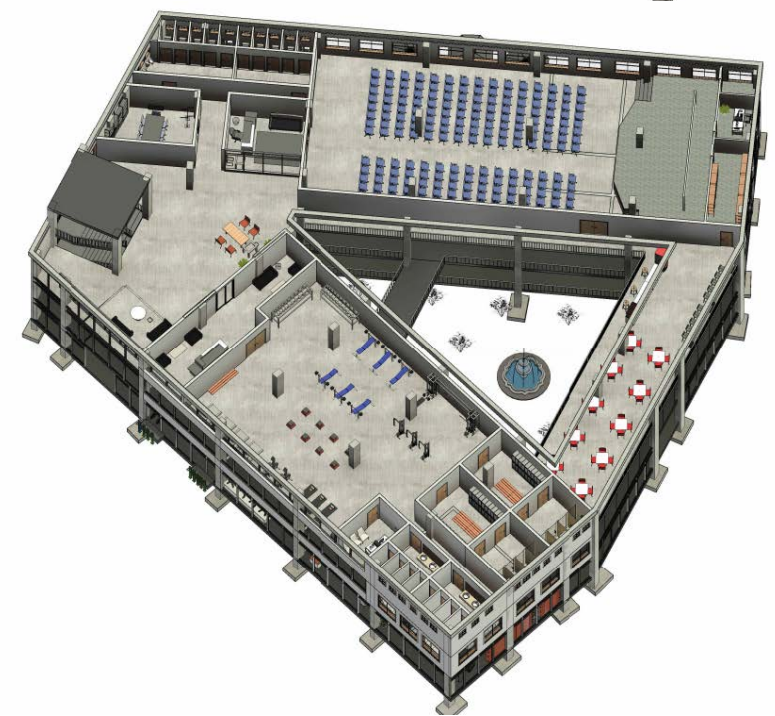

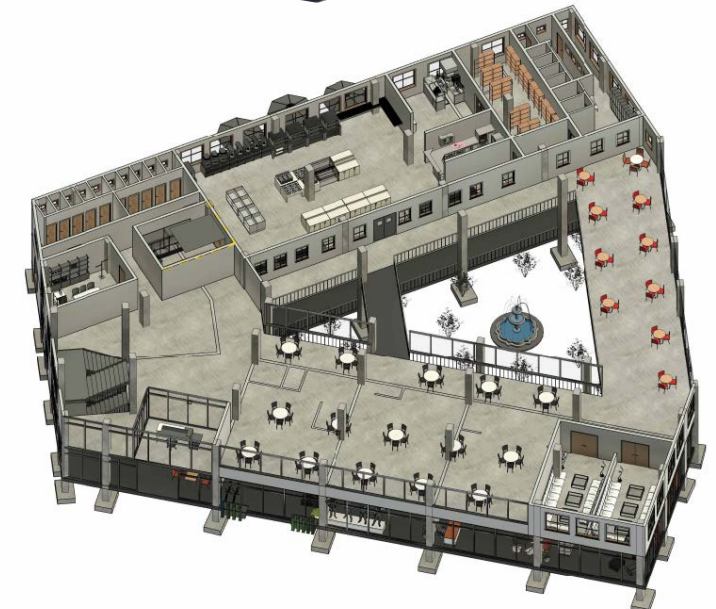

Project-06

Adaptive Corridor – Community Hall

Project Type: Community Facility

The community hall functions as a social hub within the adaptive corridor, providing a flexible space for gatherings, cultural activities, and community interaction. The design focuses on openness, adaptability, and strengthening connections between people and the surrounding urban environment.

Project-07

Foot ball field Landscape Design – At EIABC Project Type: Landscape Architecture Design Study

A multifunctional sports landscape design developed for the EIABC campus, integrating recreation, landscape, and social interaction. The project includes a football field, swimming pool, basketball court, existing vegetable gardens, and surrounding facilities such as cafés and gathering spaces.

The design focuses on creating a connected outdoor environment that combines active sports areas with green spaces, improving campus experience and community engagement.

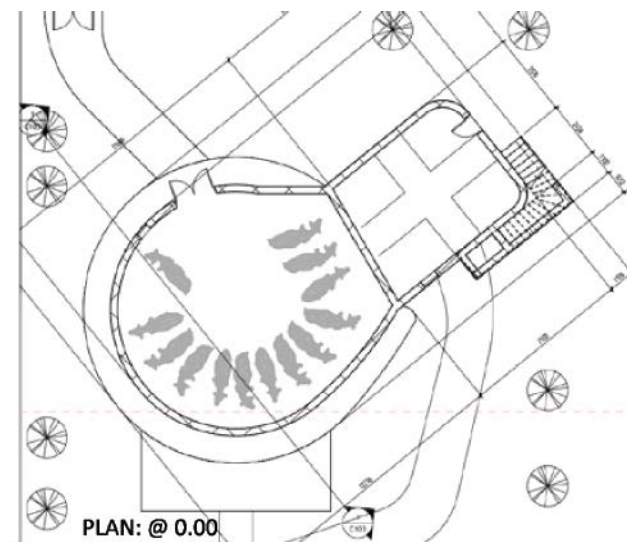

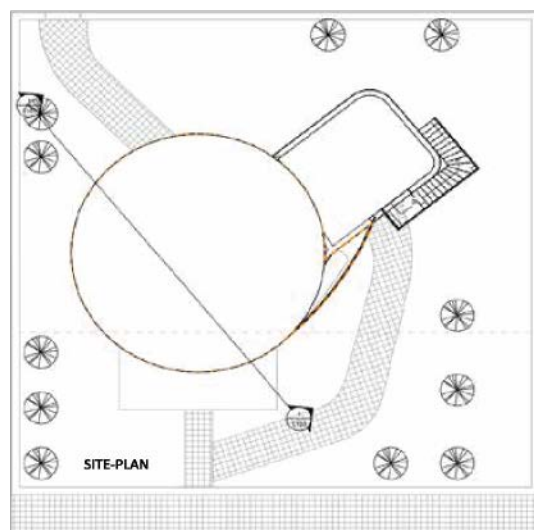

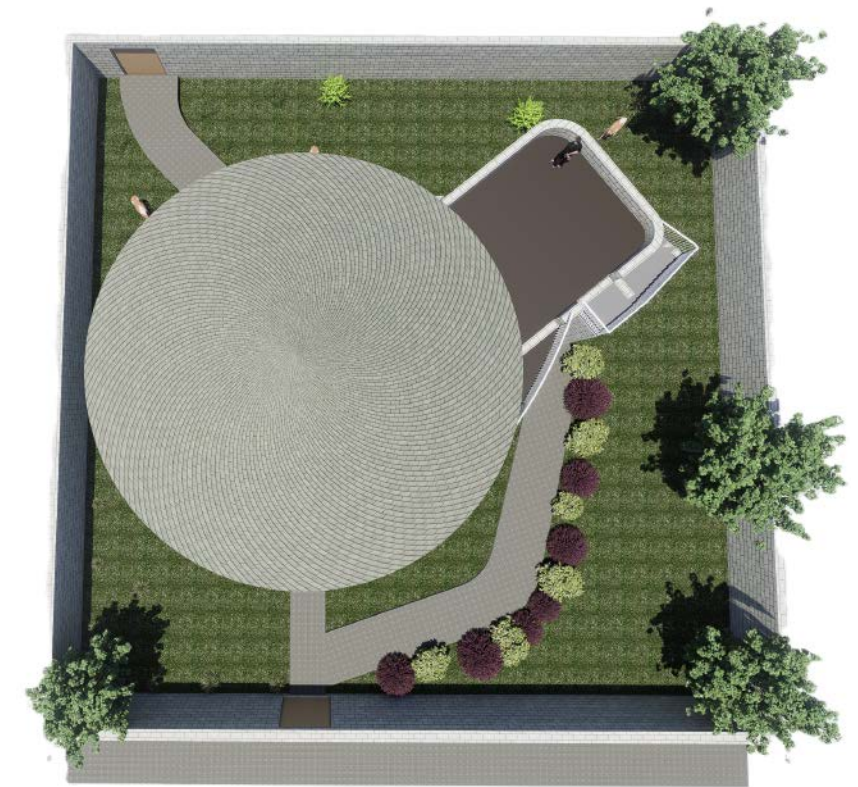

Project-08

Compact Climate Responsive House – Debre Birhan

Project Type: Appropriate Building Technology / Climate Responsive Design

A compact residential design developed for the cold climate of Debre Birhan, focusing on passive heating and thermal comfort. The design uses the concept of a thermal hearth as a central warm zone that supports heat distribution and improves indoor comfort. The compact form, spatial organization, solar orientation, and material strategies are designed to reduce heat loss, maximize solar gain, and create an energy-efficient living environment adapted to the local climate.

Project-09

A strategic urban intervention developed along the Integrated Urban Spine of Addis Ababa, focusing on the revitalization of the BGI brewery area near Mexico Square. The project explores how architecture and public space can reconnect communities with the cultural identity and memories of a place.

The design transforms an underused urban area into a vibrant social and cultural hub by integrating public activities, creative spaces, informal economies, and community-oriented experiences. The project emphasizes pedestrian connectivity, local identity, and inclusive urban interaction.

Urban Spine Revitalization Project

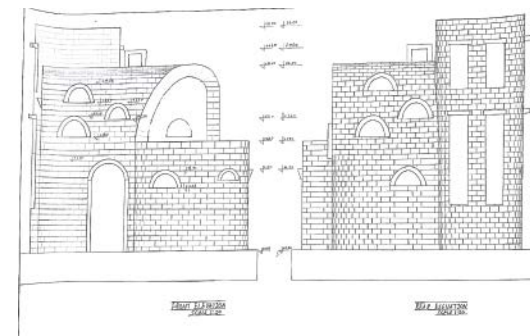

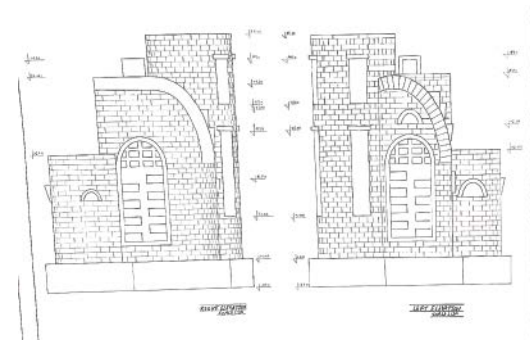

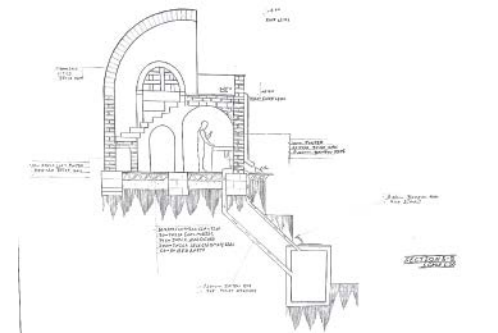

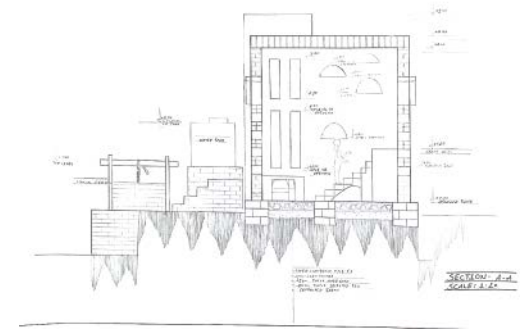

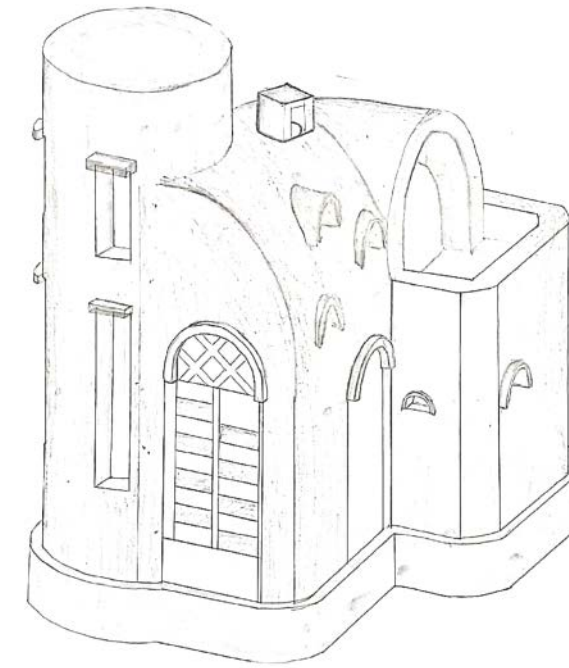

Project Type: Urban Design / Public Space Revitalization

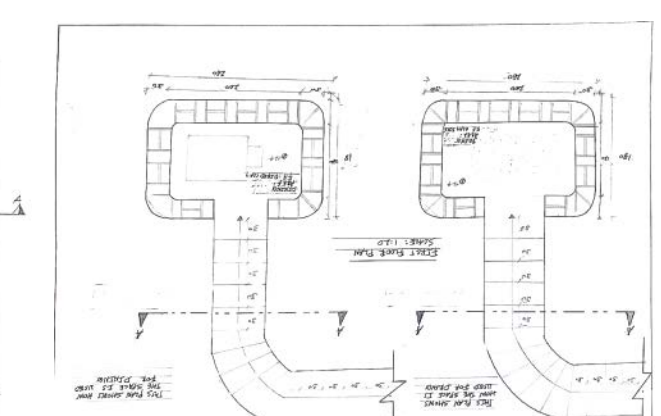

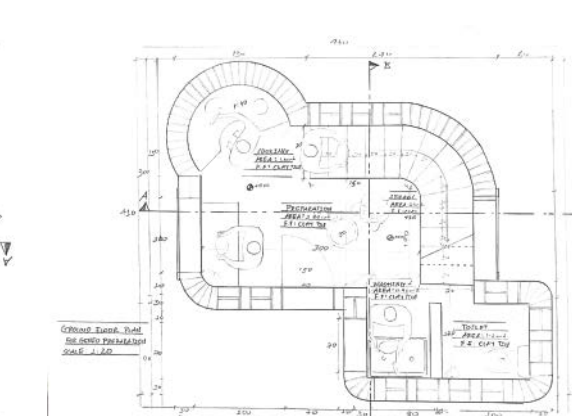

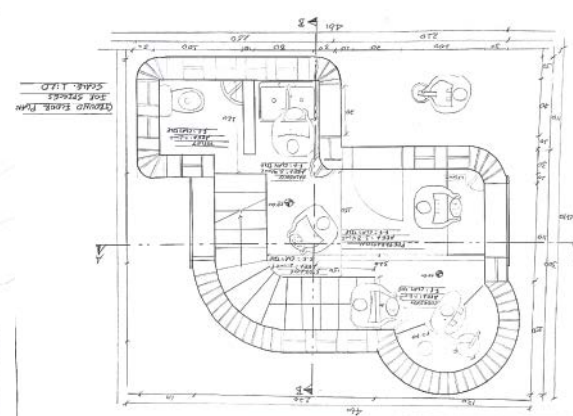

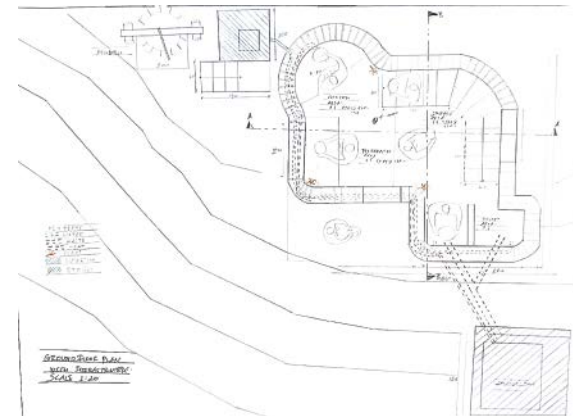

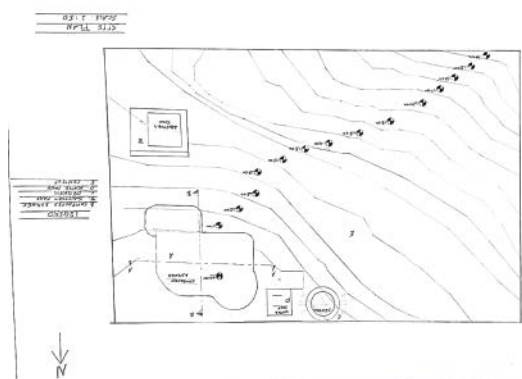

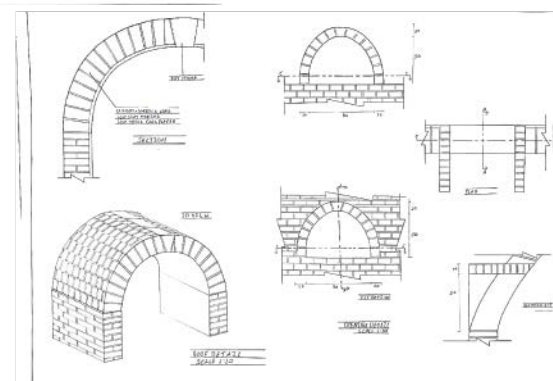

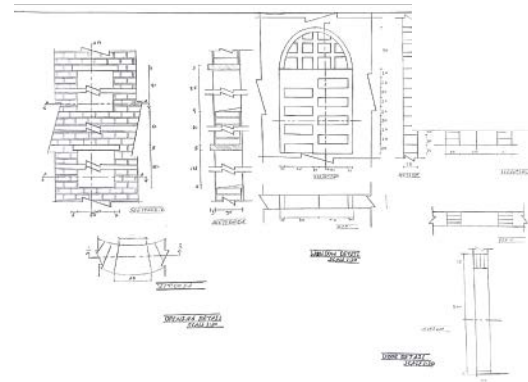

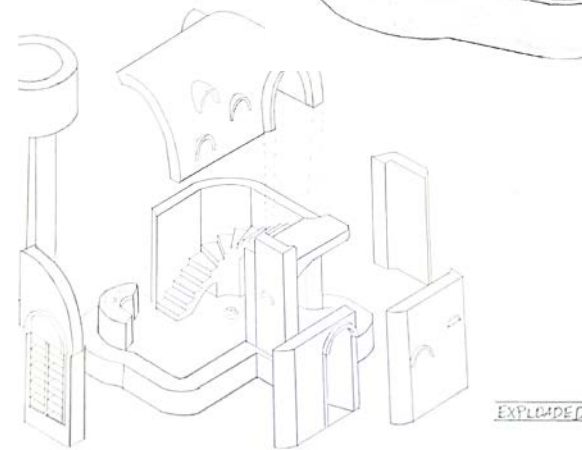

Project-10

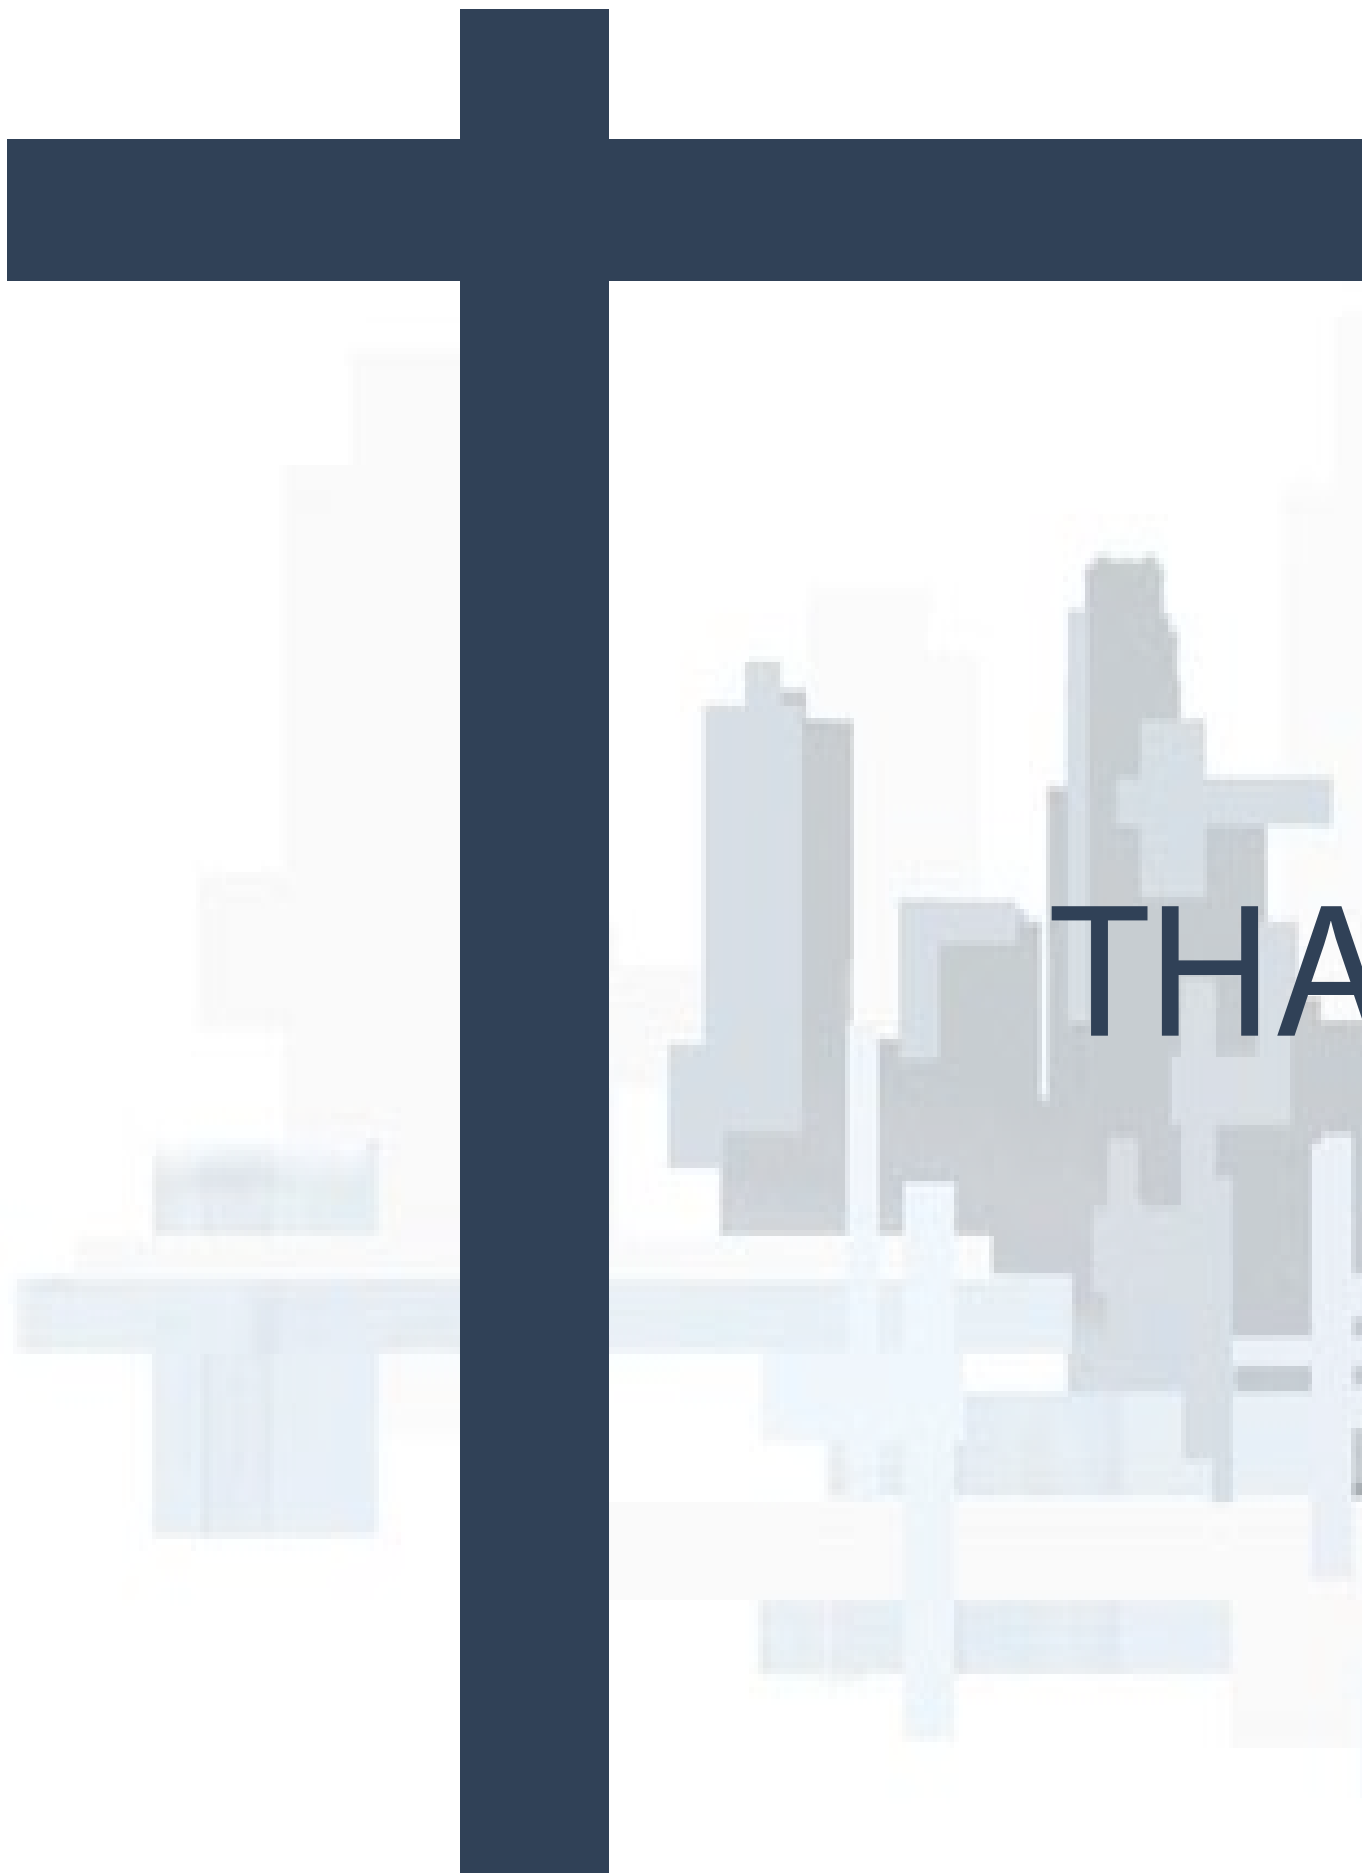

THESIS

IF LAYERED SURFACE, VENT HOLE, DOUBLE WALL WITH SEAMLESS TRANSITION MADE FROM BREATHABLE CLAY THAT RETAINS HEAT AND REGULATES MOISTURE INSPIRE DESIGN FOR HOT AND HUMID CLIMATES BY USING LAYERED PARTITION, BREATHABLE OPENINGS, POUROUS WALL AND CONTINUOUS STRUCTURE OF DESIGN TO CONTROL TEMPRATURE AND HUMIDITY NATURALLY.

BREATHABLE SPACE
